PI 01a	Cost of all neighbourhood services per household for authorities who submitted to all services
PI 01b	Percentage cost of all neighbourhood services for authorities who submitted to all services
PI 02a	Cost of neighbourhood services per household authorities who submitted to street cleansing, grounds maintenance and refuse collection
PI 02b	Percentage cost of neighbourhood services, authorities who submitted to street cleansing, grounds maintenance and refuse collection
PI 03	Headline performance indicator for the local environment - acceptable standard (Scotland and Wales)
PI 04	Percentage of sites surveyed falling below grade b for cleanliness (England only) BV 199
PI 05	No of litter offence fixed penalty notices issued per 1,000 head of population (issuing authorities only)
PI 06	Number of incidents of fly-tipping per 1,000 households

PI 08	Percentage of budget allocated to education and publicity initiatives
PI 09	Number of educational/ publicity campaigns organised or supported
PI 10 & 11	Inspection and subsequent removal of abandoned vehicles
PI 12	Number of Green Flag awards received for parks and green spaces per 100,000 households
PI 13	Kg of residual waste sent to landfill per annum per household
PI 14	Number of category one defects per Km of maintained road
PI 15	Percentage of street lamps not working as planned
PI 16	Percentage of lamps restored to working condition within 7 days

# Introduction

Over the past year we have been working on proposals for the development of a comprehensive local performance framework for neighbourhoods, which utilises the vast array of data now contained in the performance networks model. We have held discussions with ENCAMS, CABE Space, the Local Government Association National Environmental Officers Network (NEON) and others about developing a flexible local performance framework that takes into account processes, standards and outcomes.

This report is the culmination of some of that work. Utilising historical data from the performance networks database, we have attempted to demonstrate how such a local performance framework could work in the future. The report provides comparative data on a range of services and gives a UK and Northern Ireland wide perspective on this important issue.

This interim neighbourhood management report allows authorities to compare performance over a range of services, which impact on the public realm. It includes a series of outputs from a set of selected data from the separate APSE performance networks models. It draws on the data collection for five service areas, street cleansing, parks & grounds maintenance, refuse collection & recycling, highways & winter maintenance and street lighting.

The aim of this report is to provide a set of measures to triangulate cost, quality and customer perception across these neighbourhood services. We recognise that there is no standard 'protocol' for neighbourhood services and authorities have structured delivery in different ways. Therefore, the report contains both profile information on the services included in the report set as well as performance indicators to facilitate meaningful comparison.

This report contains details of the methodology used in building this performance model. There is an analysis section which provides both trend information and multi-dimensional comparisons; cost against quality and performance against perception measures. This provides further evidence to answer questions about whether public perceptions reflect an authority's performance and also allows for further benchmarking with other authorities who are achieving better performance across a number of measures.

I hope you will find this report both interesting and informative. We fully intend to build upon the outputs of the work so far in order to ensure that performance networks is at the forefront of developing local neighbourhood based performance reporting. Our ambition is to ultimately develop a framework to measure performance on a neighbourhood/area basis. But we cannot do all of this without your support and participation. So, I would urge you to read this report and ensure that if your council is registered for any of the services involved in this neighbourhood model, that you complete and return data submissions for all services this year (2006/07). It is only if we can ensure active and widespread participation that we can continue to develop and roll out our neighbourhood model. We would welcome your feedback on this report and any suggestions for further development of the project; please complete the feedback form accompanying this report.

Mark Bramah  
Assistant Chief Executive

# Partnerships

## **IQ Software Systems**

IQ Software Systems have been contracted to provide IT support for the Performance Network service and database. IQ Software Systems are able to provide additional reports and analysis on behalf of APSE Performance Networks members, facilities, Family Groups or regions by consultation. In most cases, additional report commissions outside the APSE Performance Networks service agreement will incur an additional cost.

If you would like to discuss your requirements or receive further information, please contact Debbie Johns at the APSE office.

## **Beacon Dodsworth**

APSE Performance Networks and IQSS have enlisted the services of Beacon Dodsworth, a leader in the field of geographical information analysis and geo demographic socio-economic profiling. Beacon Dodsworth have provided APSE Performance Networks with the capacity to assess effectively the geo demographic profile of each local Authority member through their Prospex software.

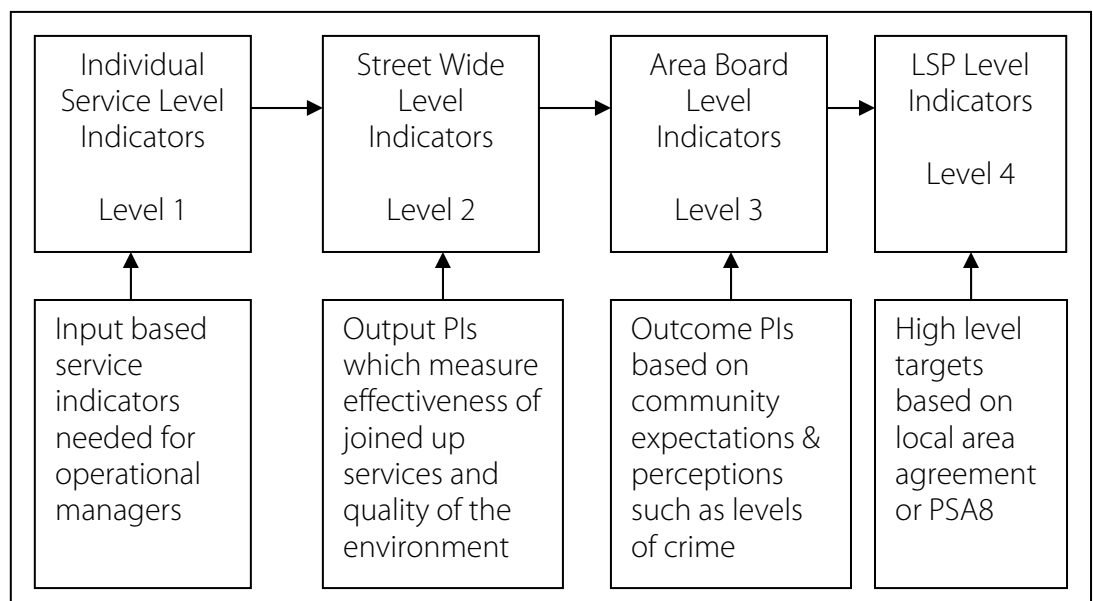

Enquiries for geo demographic profiling should be directed through Cheryl Walker at the APSE office.

## Background

This interim “neighbourhood management” report gives the first series of outputs from a set of selected data from the separate APSE performance networks models for street cleansing, parks and open spaces, refuse and recycling collection, highways management and street lighting. The model has evolved from earlier trials of a “streetscene” format report. It is an initial measured response to the way in which many local authorities have consolidated services which impact on the public realm in terms of their appearance and condition and gives a series of reports that allow authorities to compare performance over a range of services. It also recognises the fact that there is no standard prototype for neighbourhood services and that authorities have structured themselves in many different ways to deliver these joined up services.

The report has been drawn up by a steering group consisting of practitioners, BVC consultants and APSE staff and has already been influenced through presentations at various seminars and advisory group meetings over the last year or so. It has been put together in such a way as to be appropriate to different levels of an organisation with four being identified from operational through to strategic area management. The eventual aim is to create a set of reports to enable local authorities to select an appropriate basket of indicators on which to measure their performance and the impact it has on their citizens and their well being based.

APSE have also involved partners such as ENCAMS and the Local Government Association (LGA) to develop the model towards a “Local-National Framework”, a response to the 2006 White Paper “*Strong and Prosperous Communities*”, which has advocated replacing CPA in England. Discussions with these partners have confirmed that there is need for local performance management and that this was best done through a practical, commonly adopted system that allows relevant comparisons to be made and, ideally, which can also report on any national indicators required by Government. A model such as that shown below may form part of new arrangements for its successor the “*Comprehensive Area Assessment*” and work on this continues.

Further development of the APSE neighbourhood model will include ensuring that it caters for the significant legislative differences across the UK. In the meantime, this interim report is an attempt to link the aspects that make up neighbourhood services by drawing on available Performance Networks data to provide comparisons on a wider level, a first stab at seeing what the information looks like when presented together for the first time.

APSE is very keen to receive feedback from any of its members who are included in this first run. There has been a positive response during the development stage, with recognition of the important part in future performance management arrangements this model could potentially play.

## Methodology

As mentioned earlier, this model draws on the data collection for five service areas, street cleansing, parks & grounds maintenance, refuse collection & recycling, highways & winter maintenance and street lighting. The intention is that there would not be a separate data collection template as data would be gathered from existing templates. To qualify for inclusion, an authority must participate in at least two services, one of which must be street cleansing as this service is considered fundamental to the management and improvement of neighbourhoods. The reports are based on data collected for 2005/2006 (year 8) and include the following participation levels:

All 5 services	16 authorities
4 services	14 authorities
3 services	32 authorities
2 services	16 authorities
Total	78 authorities

The reports vary from the traditional family group structure because they are a collection of service areas. To keep the tables and reports to a manageable size, authorities have been grouped as follows.

Central (CE)  
South (SR)  
Scotland (SC)  
Wales and Northern Ireland (WI)  
Northern Metropolitan councils (NM)  
Northern District council (ND)  
Northern Unitary councils (NU)

The information can however be manipulated into any combination such as London boroughs only.

A range of initial service profile and performance indicators has been selected, drawn from each of the individual service areas. The aim is to provide a set of measures linked to the triangulated themes of cost, quality and customer perception, which would allow for meaningful comparison with authorities who provide similar services and would enable analysis of the effects of change on each of them.

Cost indicators per household have been included for each of the constituent services, alongside an aggregated total for the "street-scene" type delivery. These are displayed as stacked bar charts showing both cost per neighbourhood of each service and the percentage of the total spent on each particular service. Previous analysis of Performance Networks data has shown the importance of budget against quality of service and customer satisfaction, particularly when spend is comparatively low. To receive further value from this

model, authorities will be encouraged to gather financial data down to Area/Ward level in future.

In the absence of standard public perception results, APSE collected data from individual service data templates last year to provide customer satisfaction results, irrespective of the source (APSE, MORI, Citizen Panel, etc.) Recognising that there are validation issues, there is definite merit in attempting to standardise this process in future. For the time being, however, they provide an indication of public mood within each service area.

Quality measures have been taken from current data collection, with an emphasis on the aspects that have the greatest effect on "Quality of Life" in the physical environment, such as cleanliness, recycling and street lights working, as well as anti-social issues like fly tipping and abandoned vehicles. In some cases, data is already being collected from other sources, such as national Best Value Performance Indicators, "Flycapture" etc. In these instances, these are the figures that will be used in this model in future, to ensure consistency and avoid duplication. Additionally, where other organisations carry out their own measures of quality, such as ENCAMS Local Environmental Quality Surveys (LEQS), APSE is pursuing partnership arrangements to bring such data into the model.

The methodology behind many of the selected indicators enables these to be analysed against others to give valid comparison of resources allocated to individual services. This allows for greater detection of problems and potential improvement areas, especially when comparing the like for like performance of others. In addition, the model will enable future analysis of the effects of changes in service delivery on quality and public satisfaction levels as measures of continuous improvement.

# Analysis

## Overview

The following analysis aims to provide participating authorities with a picture of what the service trends are, what this infers and what further activity and analysis individual Authorities and the APSE Advisory Group networks could consider. Additionally, a range of multi dimensional "scatter graphs" are included. These triangulate cost, quality and satisfaction for a range of selected indicators.

The analysis in this Executive Summary is based on averages service-wide.

## Trend analysis

Particular points of interest are as follows:

The headline financial indicator for street cleansing (PI03 cost per household in the street cleansing model) has shown significant increases and the trend continued in 2005/06. This reflects the increased emphasis invested in the public realm and street environment with the prominence of the liveability agenda. A key question is has this extra investment led to improvements?

This can be answered by the trend graph on the next page of the indicator linked to the national BVPI 199 (PI 37b: % of sites that fall below Grade B - England) which shows an average improvement from 15.47% to 14.84%. The introduction of BVPI 199 has been a major driver in improving standards and raising the profile of street cleansing in England. For next year, data will be collected for all land types under BVPI 199. Other indicators confirm this trend UK wide with the performance indicator for acceptable levels of cleanliness showing an improvement from 89.66% to 90.54%.

A further reason for the increase in costs is related to the extra enforcement now being undertaken. The average number of fixed penalty notices issued for litter offences has risen by 51% from 2004/05.

The cost of the refuse collection service per household including CEC's (PI 01a in the refuse collection model) is a key cost indicator and has increased steadily over the period since 2000-01. This increase is to be expected as local councils and the Government continue to give recycling a high priority and new initiatives are introduced to increase recycling rates coupled with increased disposal costs. The cost per household was £50.54 in 2004-05 and increased to £55.10 in 2005-06, an increase of 9%. This increase is slightly less than the increase over the previous 2 years. The rate of cost increases has been relatively consistent over the past 5 years.

The percentage of the total waste collected which is recycled has grown from 16.23% to 21.27% over the past year whilst the percentage composted has gone up from 4.78% to 7.28%. The figures are in line with national figures.

For parks, open spaces and horticultural services, the headline cost per household has increased by 6.5% over the year to £53.64, which is above the rate of inflation. This follows an increase of 3.6% in the previous year. This trend is confirmed when also compared with the cost per thousand head of population indicator which gives similar trend results albeit with a greater long term growth rate.

The output specification indicator (PI23 in the parks model) measures three key factors; quality standards, frequency of operation and chemical control methods and is an important measure of improved maintenance service standards. The graph below show that standards continue to improve and have reached a new high point.

Damage to roads and pavements made safe within target time has increased since 1999/2000 to 2005/06 from 75.72% to 94.77%.

The percentage change in category one defects performance across all authorities ranges from a reduction of 70.54% to an increase of 90.63% and 13 out of the 32 authorities participating in this performance indicator had decreased the number of defects.

The percentage of street lamps restored to working condition within 7 days has remained stable - above 90% in the last four years. In addition, an average of 98.69% of emergency call outs have been completed within response times, compared to 97% last year (2004/05).

## Multi-dimensional analysis

Further analysis can be drawn from performance networks across dimensions of cost, quality and satisfaction by graphically displaying the results from quantitative and qualitative indicators. Below are some examples of this:

In the above analysis, authority reference 304 is a good performer; achieving a comparatively high number of green flag parks against a below average cost of the service.

The below graphs show performance on street cleansing compared against public satisfaction, for northern region, central and southern regions and Scotland and Wales,

The above scatter diagrams for street cleansing show there is a correlation between achieving a lower percentage of sites falling below grade b for cleanliness (BV199) and a higher satisfaction rate. For instance, authority 195 is achieving a comparatively low BV199 and the highest satisfaction rate in northern region. Similarly, for Scotland and Wales, those authorities achieving a high satisfaction score (authority 150 and 245) are achieving a comparatively high score for an acceptable standard of cleansing.

### Interpretation of data

From all the analysis, it is noticeable that there is strong evidence of improvement across the last seven years. The data can be interpreted as follows:

The increase in street enforcement Fixed Penalty Notices is an indication of the rise of enforcement to tackle neighbourhood problems. This will also have contributed to rising costs, as will the expansion of education programmes under the current agendas.

There is a relationship between how clean an authority's street are (performance) and public satisfaction with street cleansing services. This demonstrates the visibility of street cleansing to the public and its pivotal role to the management and improvement of neighbourhoods.

The ongoing increase in recycling activity is the driving factor behind much of the developments occurring across the wider waste management service area, as the culture of change gathers pace.

There is evidence of continuous improvement in parks related services across a range of indicators covering cost, productivity and quality. Despite increases in costs, much of this is attributed to improvements in service quality, as can be evidenced by such factors as the rise in number of Green Flag parks, site based parks staff, ranger services and an increased focus on events. The changes to the model for the next round of data collection will allow these factors to be measured for the first time and should provide conclusive evidence that can be used by officers in future budget calculations. Additionally research from bodies such as CABE and Natural England has promoted the importance of investing to make improvements in parks as part of the Healthy Living agenda.

The Output Specification indicator for parks has also continued to increase showing that specifications (and quality of the service provided) continue to improve. The new Environmental Practices indicator will hopefully demonstrate further proof of this once year on year trends become available.

The increase in the percentage of street lighting emergency call outs being completed within response times obviously has an impact on public safety and on the quality of the environment.

There is a correlation between the increase in the percentage of damaged roads and pavements made safe within target times and the reduction in third party claims; reflecting the proactive approach that Local Authorities are taking in making roads safer.

### **Future focus**

The new performance management environment will drastically reduce the number of performance indicators. There is no doubt that external inspection, in the form of the various national audit bodies, will still be interested in the performance levels of councils and individual services and the evidence behind this performance but some form of higher level measures will also be required. Performance indicators will remain a vital element of performance management even though the Government appears willing to pass on the responsibility for performance measurement to local authorities. As a result, Performance Networks will take on a more important role helping to fill the gap left by reduced Government requirements.

**Debbie Johns and John Marsh**

**Principal Advisors**

## Report parameters

Most of the Performance Indicator (PI) Reports have set parameters which define the acceptable ranges for the calculated data for that report (i.e. the calculated data must fall within the acceptable range for an Authority to be included in and receive that particular PI Report).

These usually consist of a highest and lowest acceptable output calculation although some PI Reports may only have one parameter and others may be unrestricted.

If your Authority does not appear in a particular PI Report, it may be that you have been excluded because your data falls outside these parameters. To assist with checking this, the parameters used are defined below.

### Performance indicators

- PI 01a Cost of neighbourhood services per household authorities who submitted to all relevant neighbourhood services: >0
- PI 01b Percentage cost of all neighbourhood services for authorities who submitted to all relevant neighbourhood services: >0
- PI 02a Cost of neighbourhood services per household authorities who submitted to each of refuse, street cleansing and grounds maintenance: >0
- PI 02b Percentage cost of all neighbourhood services for authorities who submitted to each of refuse, street cleansing and grounds maintenance: >0
- PI 03 Headline performance indicator for the local environment – acceptable & high standard (Scotland & Wales only): >0
- PI 04 BV199 percentage of sites surveyed falling below grade b for cleanliness (England only): >0%
- PI 05 Number of litter offence fixed penalty notices issued per 1,000 head of population(issuing authorities only):>0
- PI 06 Number of incidents of fly-tipping/dumps per 1,000 households (England/Wales only from DEFRA fly-capture database): >0
- PI 08 Percentage of the street cleansing budget allocated to education & publicity of initiatives: >0%
- PI 09 Number of street litter educational/publicity campaigns organised/supported: >0 and <110
- PI 10 Number of vehicles reported & inspected and identified as abandoned per 1,000 households: >0
- PI 11 Percentage of identified abandoned vehicles removed: >0%
- PI 12 Number of Green Flag awards received for parks and green spaces per 100,000 households: >0
- PI 13 Kg of residual waste sent to landfill per household: >0
- PI 14 Number of category 1 defects per 100 km: >0 and <10
- PI 15 Percentage of street lamps not working as planned: >0% and <20%
- PI 16 Percentage of lamps restored to working condition within 7 days: >50%

For the community/customer survey profile pages, there is a parameter of >0.
